

**PUBLIC SERVICE COMMISSION
OF WEST VIRGINIA
CHARLESTON**

CASE NO. 07-0508-E-CN

**TRANS-ALLEGHENY INTERSTATE
LINE COMPANY**

Application of Trans-Allegheny Interstate Line Company for a certificate of public convenience and necessity under W. Va. Code § 24-2-11a authorizing the construction and operation of the West Virginia segments of a 500kV electric transmission line and related facilities in Monongalia, Preston, Tucker, Grant, Hardy, and Hampshire Counties, and for related relief.

DIRECT TESTIMONY OF HALE POWELL

Q. PLEASE STATE YOUR NAME AND ADDRESS.

A. My name is Hale Powell, and my business address is HPowell Energy Associates, 20 Acton Rd, Westford, Massachusetts, 01886.

Q. PLEASE DESCRIBE YOUR EDUCATIONAL BACKGROUND AND PROFESSIONAL EXPERIENCE.

A. I have been an active professional in the electric utility industry since 1980 with a primary focus on the acquisition of electric system resources by means of improved ratepayer energy efficiency and reduced peak demand. Over the past 27 years I have been involved in every phase of demand side resource acquisition including market assessments, cost effectiveness analysis, DSM program design and marketing, equipment installation, performance assessment and metering and regulatory support. Since 2003 I have been an independent consultant specializing exclusively in demand side program design and associated regulatory issues. The bulk of my consulting practice entails providing technical and analytic support to utility DSM programs. My current major projects involve enhancing demand program designs for industrial energy efficiency in multiple New England states and participating in a formal collaboration with six Northeast states to reduce growing peak demand impacts from residential air conditioning systems.

1 I also have provided input and expert testimony in a variety of state regulatory
2 settings. During 2007 I have participated in power plant approval dockets in
3 Florida and Oklahoma in which approvals for new coal capacity investments were
4 denied by state regulators. I am currently involved in a similar docket in the state
5 of Louisiana. Most recently, following the denial of new coal generating capacity
6 in Oklahoma, I have been involved in the development of regulatory rules to
7 assist in the broad development demand side resources in that state
8

9 During the period 1992-2002 I was employed as a senior DSM evaluation and
10 program design specialist at National Grid USA, a major electric utility with one
11 of the most aggressive demand side programs in the US. National Grid has retail
12 electric and gas operations in Massachusetts, New York, Rhode Island and New
13 Hampshire.
14

15 From 2002-2003 I was employed by the Northeast Energy Efficiency Partnership
16 (NEEP) an eight state regional collaborative funded by regulated utilities, the
17 USDOE and the USEPA. While at NEEP I worked with utilities and regulatory
18 officials in five states to increase energy efficiency and reduce peak demand
19 impacts by means of enhanced energy code requirements for new residential and
20 commercial buildings.
21

22 In 1989 I received a Bachelors degree in Public Policy from Hunter College. I
23 earned a Master of Science degree from the University of Pennsylvania in 1991 in
24 Energy Management and Policy with a specific concentration on demand side
25 electric resources, energy policy and utility regulation.
26

27 Q. HAVE YOU REVIEWED TRAILCO'S APPLICATION FOR A CERTIFICATE
28 OF CONVENIENCE AND NECESSITY AND ITS SUPPORTING
29 DOCUMENTS?
30

31 A. Yes. In addition, I reviewed various discovery responses and other documents
32 from TrAILCo, Allegheny Energy, PJM Interconnection and a variety of other
33 materials as listed in my exhibits.
34

35 Q. PLEASE DESCRIBE YOUR EXPERIENCE IN THE METHODS AND
36 APPLICATIONS OF ELECTRIC RESOURCE PLANNING AND
37 RATEPAYER DEMAND REDUCTION STRATEGIES.
38

39 A. As an electric utility employee for National Grid during the period 1992 to 2002 I
40 was engaged in the planning, evaluation and implementation of large scale
41 demand and energy reduction programs targeted at the residential, commercial
42 and industrial sectors in Massachusetts, New Hampshire and Rhode Island.
43

44 As a private consultant since 2003 I have continued to assist National Grid (and
45 other utilities) in the design and implementation of demand side programs. As an
46 indicator of the scale of these demand side programs, in 2005 alone, a total of

1 653,481 customers participated, in Massachusetts alone, producing 201 GWH of
2 energy savings and 22.9 MW of peak summer savings¹.

3
4 From a broader perspective, my recent involvement in a variety of state regulatory
5 proceedings has familiarized me with the most recent information in respect to
6 rapidly evolving utility regulatory issues, escalating capacity construction costs,
7 and the growing probability of carbon emissions regulation. Based on this
8 experience it is clear to me that the West Virginia Public Service Commission
9 will have the task, in this case, to make a decision in a rapidly evolving energy
10 policy and economic environment.

11
12
13 **Q. WHAT IS THE PURPOSE OF YOUR TESTIMONY?**

14
15 **A.** I was asked by the Sierra Club, an intervenor in this case, to perform an
16 independent evaluation of TrAILCo's Application for Certificate of Convenience
17 and Necessity and determine whether continued reliability of electric service in
18 West Virginia requires construction of the proposed West Virginia segments of
19 the 500-kV transmission line and the proposed upgrades to the Mt. Storm
20 substation in Grant County, West Virginia. In particular, I have been asked to
21 explain to the Commission how the aggressive application of a variety of demand
22 reduction strategies could be a preferable and more economic alternative to the
23 construction of this line.

24
25 An additional objective of my testimony is to suggest a variety of specific "next
26 steps" that might be undertaken by West Virginia policymakers and utilities to **a)**
27 ensure a fuller analysis of all investment alternatives to the TrAIL line and **b)**
28 begin the implementation of ambitious demand reduction strategies that offer
29 broad economic and environmental benefits to West Virginia. These
30 recommendations reflect my professional judgment as well as specific
31 recommendations developed by the US Department of Energy, the
32 Commonwealth of Virginia, and a wide variety of other authorities in energy and
33 electric resource planning.

34 4

35 **Q. DO YOU BELIEVE THAT THE 500-KV TRANSMISSION LINE AND**
36 **ASSOCIATED FACILITIES PROPOSED BY TRAILCO FOR**
37 **CONSTRUCTION IN WEST VIRGINIA ARE NECESSARY AND**
38 **DESIRABLE FOR PRESENT AND ANTICIPATED RELIABILITY OF**
39 **SERVICE FOR ELECTRIC POWER IN WEST VIRGINIA?**

40
41 **A.** I believe that the materials and analysis in the TrAILCo application are not yet
42 sufficient to make an informed determination about the optimal investment of

¹ These savings have been verified by state regulators in Massachusetts. See **EXHIBIT 1** for an extract of the savings report for 2005.

1 ratepayers' monies. In my professional opinion, the application is incomplete and
2 the rationale for construction excessively narrow because it does not adequately
3 address the full range of economic alternatives that could result in lower long
4 range costs for electric service in the state. I believe that it is in the best interests
5 of the ratepayers of West Virginia to require a more comprehensive analysis of all
6 available options.

7
8 **Q. IN IT'S APPLICATION FOR CONVENIENCE AND NECESSITY DID**
9 **TRAILCO CAREFULLY CONSIDER ALL POSSIBLE ECONOMIC**
10 **ALTERNATIVES POTENTIALLY IN THE PUBLIC INTEREST?**

11
12 **A.** No. TrAILCo did not comprehensively review all alternatives. In large part
13 TrAILCo's argument in favor of the TrAIL project is based on pursuing a specific
14 "wires" approach to meeting PJM's transmission reliability criteria rather than
15 establishing conclusively that the proposed project is in the best economic
16 interests of the state's ratepayers².

17
18 For example, while TrAILCo's application devotes considerable attention to line
19 siting and reliability concerns, its testimony and exhibits have provided
20 insufficient analysis of the potential benefits and comparative costs of alternative
21 investments in the demand side electric resources.

22
23 In addition, TrAILCo's analyses did not address a variety of other issues that will
24 likely impact the long term viability of the project and the magnitude of future
25 costs likely to be borne by West Virginia ratepayers.

26
27 **Q. PLEASE BRIEFLY SUMMARIZE THE MAJOR ARGUMENTS WHICH YOU**
28 **WILL AMPLIFY IN YOUR TESTIMONY.**

29
30 **A.** I will argue that a significant expansion of demand and energy reduction efforts in
31 West Virginia and the entire region is likely to be a preferable alternative to the
32 construction of the proposed 500kV transmission line. The provisions of the US
33 Energy Policy Act of 2005 requires the USDOE to consider all alternatives to
34 conventional transmission corridors, including "non-wires" options which may
35 improve reliability by means of the targeted reduction of peak demands of retail
36 and wholesale electric customers. We believe that the interests of West Virginia
37 ratepayers require an equally rigorous assessment of these alternatives to the
38 proposed TrAIL line. The absence of such a comprehensive analysis in
39 combination with other factors leads me to conclude that WVPSC approval of the
40 proposed transmission line at this time does not serve the public interests of West
41 Virginia. Specific reasons for this conclusion include the following:

² A so-called "wires" approach to transmission congestion places its primary emphasis on the construction of new transmission transfer capacity. In contrast, a "non-wires" approach is one that seeks to avoid large scale capital projects with significant environmental impacts. "Non-wires" approaches often emphasize the use of targeted reductions in ratepayer peak demand as a preferred strategy to reduce transmission congestion.

1. The Assessment Provided by TrAILCo is Insufficient to Reduce Ratepayer Risks. West Virginia, the United States and entire global energy market are in a period of extraordinarily high uncertainty about future electricity demand, energy prices, future state and federal energy policy and the prospects and implications of carbon emissions regulation. Given this uncertainty, TrAILCo’s application utterly fails to address any of these risk factors that may impinge on the economic viability of the proposed line. Because these risks and uncertainties are left unaddressed, West Virginia ratepayers and taxpayers cannot be assured that the proposed line is the most “economic” and least cost approach for providing reliability and other economic benefits to WV ratepayers. Nor can they be assured that their collective investment of ratepayer dollars in this project will result in an economically viable asset. A higher level of scrutiny of these issues is both prudent and imperative and constitutes a reasonable requirement on the part of the Commission.

2. Demand Reductions are Available to Provide Needed Reliability Benefits Demand reduction strategies and programs are vastly under-developed in West Virginia and the entire region to be served by this line. Savings produced by demand reduction programs targeted at large customers is extremely limited and virtually no effort has been made to address these demand resources in the residential or medium/small commercial customer sectors that make up the bulk of system electric demand. In contrast, comprehensive demand reduction strategies have been widely and successfully implemented in other regions of the US to reduce demand growth.

A more effective and ambitious implementation of these strategies in West Virginia and PJM as a whole can cost effectively produce large demand reductions that can address the congestion and reliability issues raised by the applicants. The “need” for the TrAIL transmission line does not reflect an immutable and unavoidable fact; instead, it merely reflects a failure to successfully restrain demand growth using policy and programmatic tools readily accessible to both policy-makers and utilities.

3. Expanded Demand Reduction Efforts Will Yield Broad Economic Benefits That Should be Considered in the Context of the TrAIL Line Proposal. The implementation of aggressive demand response and demand side management efforts can yield broad benefits over and above transmission reliability benefits. These economic benefits include lower wholesale and retail electricity costs, reduced emissions and regulatory compliance costs, improved statewide electric resource diversity and a reduced need to make future capital investments in increasingly expensive new generation and transmission assets. A fuller consideration of these benefits should be a precondition for any approval of large scale ratepayer investments such as the proposed TrAIL line.

1
2 Q. CAN YOU BRIEFLY DESCRIBE THE TYPE OF DEMAND AND ENERGY
3 REDUCTION STRATEGIES THAT CAN HAVE A SIGNIFICANT IMPACT
4 ON TRANSMISSION REQUIRMENTS IN WEST VIRGINIA AND THE
5 BROADER PJM AREA?
6

7 A. Yes. A wide variety of such programs are described in literature developed by the
8 USDOE, USEPA, regional transmission organizations (RTO and ISO), US
9 electric utilities, regulatory filings and state governments and regulatory agencies
10 around the US. In general, these programs fall into two categories within a
11 broader grouping which may be termed “demand side resources” (DSR).
12

13 The first category is “demand response” (DR) programs which provide
14 dispatchable and other types of demand reductions as part of a RTO or utility
15 operated programs. Selected subcategories of DR programs include **a)** incentive-
16 based dispatchable programs, **b)** price-based DR programs, **c)** direct load control
17 (DLC) and **d)** capacity auctions of the type recently authorized by ISO New
18 England. These DR programs normally provide improved short term control of
19 electric end-uses in reference to system peak loads and/or transmission
20 congestion.
21

22 The second category includes so-called “energy efficiency” (DSM) programs
23 which encourage the permanent installation in ratepayer facilities of high
24 efficiency/low peak demand electric end-use equipment such as air conditioning,
25 industrial equipment, motors, lighting and other electric technologies³. These
26 programs, in contrast to DR approaches, provide permanent benefits not limited to
27 reduced load at peak periods.
28

29 Q. WHAT DOES THE 2006 PJM STATE OF THE MARKET REPORT
30 SAY ABOUT THE IMPORTANCE OF ACCERLERATED DEMAND
31 REDUCTION PROGRAMS?
32

33 A. **PJM believes that demand side programs are under-developed and need**
34 **significant expansion.** On page 89 of the State of the Market Report PJM states:
35

36 *"Markets require both a supply side and a demand side to function effectively.*
37 *The demand side of wholesale markets is underdeveloped. It is widely recognized*
38 *that wholesale electricity markets will work better when a significant level of*
39 *potential demand side response is available on the market. **The PJM wholesale***
40 ***market demand side programs should be understood as one relatively small part***
41 ***of a transition to a fully functional demand side for the energy***
42 ***market.(emphasis added) A fully developed demand side will include retail***

³ A third category of DSR resources includes “distributed generation” which includes the use of small scale generation in proximity to areas of high customer demand and/or transmission congestion. This category will not be addressed in my testimony but should be considered an additional option by the Commission.

1 *programs and an active, well-articulated interaction between wholesale and retail*
2 *markets."*

3

4 Q. IS IT YOUR POSITION THAT THESE DEMAND SIDE RESOURCES CAN
5 PRODUCE SIGNIFICANT BENEFITS THAT CAN ADDRESS THE
6 RELIABILITY ISSUES DETAILED THE TRAILCO APPLICATION?

7

8 A. This is my professional opinion. In addition, the capability of DSR induced
9 demand reductions to produce significant transmission benefits is clearly
10 underlined by the advocacy of such demand reductions by PJM and other regional
11 transmission organizations, FERC and a diverse body of research conducted by
12 government agencies, utilities, consultants and other bodies. In Table 3-2 of its
13 recently published Benefits of Demand Response in Electricity Markets and
14 Recommendations for Achieving Them⁴, the USDOE identifies a number of clear
15 benefits of DSR induced demand reductions. In terms of reliability the following
16 benefits are identified resulting from reductions in customer demand produced by
17 DSR programs:

18

- 19 - System reliability benefit: Reduced likelihood and consequences of forced
20 outages
- 21 - System reliability benefit: Diversified resources available to maintain system
22 reliability
- 23 - Customer reliability benefit: Reduced risk of losing service
- 24 - Customer reliability benefit: Reduced exposure to forced outages

25

26 In an effort to quantify these benefits the International Energy Agency (IEA)
27 contracted with Summit Blue Consulting to conduct a systematic assessment of
28 the benefits of demand reductions from DSR programs. Using a case study
29 modeling approach the study concluded that:

30

31 *"Loss of Load: The addition of demand response resources decreased the loss of*
32 *load (LOL) hours substantially across all cases. The base case had an average*
33 *value of for loss of load of 7.64 hours across the cases, but value for some*
34 *individual cases were as high as 30 hours. For the DRR with Peak Pricing, the*
35 *average loss of load hours averaged across all cases was lowered to 0.33*
36 *hours*⁵*".*

37

38 This study also substantiated additional reliability benefits for customers in the
39 form of reduced price volatility, resulting in more "reliable" and predictable
40 pricing of electricity.

41

⁴ See **EXHIBIT 2** for Benefits of Demand Response in Electricity Markets and Recommendations for Achieving Them published by the USDOE.

⁵ See page 7 of **EXHIBIT 3** - Demand Response Resources Valuation and Market Analysis: Assessing DRR Benefits and Costs, Summit Blue Consulting for the International Energy Agency.

1 **Q.** PLEASE SUMMARIZE SOME OF THE OTHER ECONOMIC BENEFITS
2 AVAILABLE TO WEST VIRGINIA AND THE PJM REGION RESULTING
3 FROM AN EXPANDED DEMAND SIDE EFFORT.
4

5 **A.** A comprehensive summary of these benefits is well beyond the scope of this
6 testimony. However, the Commission is encouraged to integrate the consideration
7 of the non-reliability economic benefits of DSR efforts as it evaluates the
8 comparative benefits and costs of the TrAIL proposal.
9

10 These economic benefits have been well researched by PJM, the USDOE and a
11 broad spectrum of research efforts. However, of particular note is **EXHIBIT 4,**
12 **Quantifying Demand Response Benefits in PJM,** a research project prepared by
13 The Brattle Group in 2007 for PJM and MADRI. This study quantified market
14 impacts of curtailing 3% of load in the BGE, PECO, PEPCO and PSEG zones.
15 Non reliability economic benefits identified and/or quantified by the Brattle study
16 included:

- 17
- 18 - Significant reductions of market electricity prices during curtailment
19 periods⁶.
- 20 - Reduction in capacity requirements needed to maintain reserve margins.
- 21 - Reduced electricity price volatility
- 22 - Enhanced competitiveness of energy and capacity markets
- 23 - **Deferred transmission and distribution costs** (emphasis added)
- 24

25 Reflecting only a limited subset of these benefits, the Brattle report estimated
26 annual benefits (in the MADRI states alone) of \$138 to \$281 million.

27 Other economic benefits that have been identified by other research include:

- 28
- 29 - Increased capital efficiency in one of the most capital intensive industries
- 30 \- Risk management in the form of a hedge against extreme physical events.
- 31 - Increased customer choice and customer risk management opportunities
- 32 - Environmental benefits associated with reduced carbon emissions
- 33 - Market power mitigation⁷.
- 34

35 **Q.** IT APPEARS THAT YOUR TESTIMONY MAKES PRIMARY EMPHASIS
36 ON DATA ASSOCIATED WITH ALLEGHENY POWER AND ITS
37 CUSTOMERS. SINCE THE TRAIL LINE WILL SERVE THE ENTIRE
38 REGION AND MULTIPLE UTILITIES WHY DID YOU CHOSE TO FOCUS
39 ON A SINGLE UTILITY FOR THIS ANALYSIS?
40

6 Brattle found that curtailing 3% of each selected zone's super-peak load, which reduces PJM's peak load by 0.9%, yields an energy market price reduction of \$8-\$25 per megawatt-hour, or 5-8% on average, during the 133-152 hours in which curtailment occurs in at least one zone.

7 For a further discussion of these benefits see **EXHIBIT 3, Demand Response Resources Valuation and Market Analysis,** Summit Blue Consulting, 2006.

1 A. My testimony is not intended to highlight the performance of Allegheny Power as
2 unique from other utilities in the region. However, in conducting research for this
3 testimony I made multiple requests to TrAILCo for detailed information about a
4 number of utilities to be served by the TrAIL line. TrAILCo responded to those
5 requests with information exclusively about Allegheny Power operations and
6 customers.

7
8 Despite the lack of detailed data on multiple utilities I believe that the Allegheny
9 Power is a representative example of many of the utilities in the region. A review
10 of regulatory and EIA data from the surrounding states suggests that AP operates
11 in a similar regulatory environment in respect to demand side activities. In
12 addition, it appears that its low level of demand side activity is broadly shared
13 with other regional utilities.

14
15
16 Q. HAS TRAILCO IDENTIFIED A SPECIFIC LEVEL OF PEAK DEMAND
17 REDUCTIONS THAT WOULD BE REQUIRED BY 2011 TO MITIGATE THE
18 PREDICTED A) MEADOW BROOK SUBSTATION VOLTAGE PROBLEMS
19 AND B) LINE OVERLOADING ON THE MOUNT STORM LINES?
20

21 A. No. Based on the TrAILCo response to SIERRA-IV-INT-3, it appears that
22 TrAILCo has not performed such a fundamental analysis. Without such basic
23 information it is impossible to compare the relative costs of potential demand
24 reductions with the costs of transmission upgrades. The TrAILCo response
25 suggests that the responsibility for such an engineering analysis should be lie with
26 intervenors, not the proponents of the TrAIL line. On the contrary, I believe that
27 the development of such information should be essential analytic element any
28 large scale ratepayer funded investment.
29

30 Q. A COMPARISON BETWEEN COSTS OF ALL ATERNATIVES IS
31 ESSENTIAL FOR AN APPROPRIATE DECISION IN THIS CASE. DOES
32 THE COMMISSION HAVE ENOUGH INFORMATION ABOUT THE COSTS
33 OF DEMAND SIDE PROGRAMS TO MAKE AN EFFECTIVE COMPARISON
34 BETWEEN DEMAND REDUCTION AND TRANSMISSION STRATEGIES TO
35 ENHANCE RELIABILITY?
36

37 A. No. TrAILCo application does not adequately address the costs of demand side
38 alternatives to the TrAIL proposal. However, a variety of estimated cost data is
39 available from a number of sources. Among these sources is a recent regulatory
40 filing in Maryland in which Allegheny Power estimated that 141MW of peak
41 demand reductions could be achieved for a cost of \$23.69 million.
42

43 The Commission should request that TrAILCo review these and other demand
44 reduction cost estimates produced by regulators, government agencies and
45 utilities. Following this review TrAILCo should provide a report to the WVPSC

1 on the comparative costs, per peak MW, between the TrAIL project and
2 reasonably achievable demand reduction strategies.

3
4 **Q.** WHAT ELECTRIC MARKETS WILL THE PROPOSED TRAIL LINE SERVE?

5
6 **A.** In response to discovery TrAILCo has resisted identifying specific markets to be
7 served by the line, insisting that the transfer capacity is intended to serve the
8 entire region and not specific utilities or states. However, it is clear from the
9 routing of the line and PJM's Regional Transmission Expansion Plan (RTEP) that
10 primary markets to be served include areas of rapid demand growth in Northern
11 Virginia, Maryland, Pennsylvania and the District of Columbia. Estimates of five
12 year demand growth by 2011 in those areas is approximately 2500 MW, very
13 close to the transfer capacity of the proposed TrAIL line⁸.

14
15
16 **Q.** IS IT YOUR POSITION THAT THE WEST VIRGINIA PSC CAN
17 EFFECTIVELY PROMOTE THE EXPANDED DEVELOPMENT OF
18 DEMAND REDUCTION PROGRAMS IN WEST VIRGINIA AND THE PJM
19 REGION?

20
21 **A.** Yes. As discussed in depth elsewhere in this testimony the WVPSC can and
22 should adopt a variety of regulatory mechanisms for West Virginia that have been
23 used in other state venues to promote the expansion of demand side resources.
24 These regulatory initiatives include **a)** the removal of financial disincentives, **b)**
25 the establishment of DSR program cost recovery and **c)** the implementation of
26 financial incentive mechanisms that reward state utilities for verified demand and
27 energy reductions resulting from successful DSR programs.

28
29 In respect to out-of-state demand reductions the PSC cannot exert direct influence
30 on the policies and programs implemented in Virginia, Pennsylvania and other
31 adjoining PJM states. However, a variety of indirect approaches have the potential
32 for exerting considerable influence on the energy policies and programs pursued
33 in those states. Among these strategies include close collaboration with PJM
34 efforts to “ramp up” demand response programs and to promptly implement a
35 RTO capacity auction which includes actionable demand reductions modeled on
36 the Forward Capacity Market initiative adopted by ISO New England.

37
38 A requirement by the WVPSC that TrAILCo conduct a much more extensive
39 assessment of the costs and availability of achievable demand side resources
40 should also produce credible and well researched information on this resource that
41 will aid other states in weighing the comparative benefits of these alternatives. As
42 an example of this type of influential research see **EXHIBIT 5**, the Virginia
43 Energy Plan recently produced by the Commonwealth of Virginia.

44

⁸ For sources of this data see the following: PJM RTEP, pp 171, 215, 270 and 297. Also see sources cited in **EXHIBIT 6**, “How Dominion and Allegheny Power Got it Wrong”, page 10.

1 In contrast, the premature approval of the proposed TrAIL transmission project
2 based on incomplete analyses of demand side alternatives will likely retard the
3 development of these resources outside West Virginia. In that case, unrestrained
4 and accelerating demand growth in rapidly growing urban and suburban areas
5 outside the state will likely exacerbate future threats to reliability for West
6 Virginia ratepayers.

7
8
9 **Q. IN YOUR OPINION, WHAT ISSUES OF SIGNIFICANT ECONOMIC**
10 **IMPACT WERE NOT ADDRESSED BY THE TRAILCO APPLICATION?**

11
12 **A.** At least two significant issues of this type were not addressed in the TrAILCo
13 Application.

14
15 The first is the possible impact of the enactment of Federal carbon emissions
16 regulation on the economic viability of the TrAIL line. In recent years the level of
17 scientific, public and political support for controlling greenhouse gas emissions
18 has increased rapidly. Several years ago the probability of the enactment of such
19 legislation was low. However, I believe that these probabilities have risen to a
20 point where utility resource planning cannot prudently ignore this regulatory
21 scenario and its likely associated ratepayer costs.

22
23 A second issue not fully considered are the possible implications on the TrAIL
24 line of reduced rates of future electric demand growth in areas to be served by the
25 line. An increasing number of states, including Virginia, are adopting policy
26 objectives to **a)** reduce demand growth below current levels, **b)** increase consumer
27 energy efficiency and **c)** reduce greenhouse gas emissions associated with
28 electricity generation. My subsequent testimony will review the reasons for
29 accelerating efforts in this regard as well as specific initiatives pursued by states
30 governments, regional transmission organizations, and utilities with the objective
31 of achieving these goals.

32
33 **Q. WHAT PERCENTAGE OF TOTAL TRAIL LINE COSTS DOES TRAILCO**
34 **ESTIMATE AS THE RESPONSIBILITY OF WEST VIRGINIA**
35 **RATEPAYERS?**

36
37 **A.** In its revised application dated May 23, 2007 TrAILCo estimated that state
38 ratepayers will be responsible for 4.2% of the revenue requirements associated
39 with the TrAIL line.

40
41 **Q. CLIMATE CHANGE AND CARBON EMISSIONS HAVE BECOME A**
42 **SERIOUS CONCERN FOR POLICY MAKERS. IN WHAT FASHION DID**
43 **TRAILCO ASSESS THE IMPLICATIONS FOR THE TRAIL LINE OF THE**
44 **POSSIBLE ENACTMENT OF CARBON REGULATION?**

45

1 A. TrAILCo did not conduct an analysis of either the likelihood of carbon regulation
2 or of possible implications of carbon emissions regulation and associated costs on
3 the future viability and needs for the TrAIL line. In particular, TrAILCo did not
4 assess the implications of carbon allowances or taxes on the financial
5 performance of their proposed asset.
6

7 Q. IN YOUR OPINION, WHAT ARE THE POSSIBLE IMPLICATIONS FOR THE
8 TRAIL LINE IF A CARBON TAX OR “CAP AND TRADE” REGULATORY
9 REGIME IS IMPLEMENTED AT THE FEDERAL LEVEL?
10

11 A. Lacking access to detailed financial, electricity transfer and emissions data
12 associated with the projected operation of the TrAIL line I cannot identify precise
13 impacts. For example, I cannot estimate at what point the costs of “carbon
14 allowances” associated with a cap and trade system would erode the price
15 differential between electricity generated by gas and the coal based power likely
16 to be transferred via the TrAIL line.
17

18 The economic viability of the proposed line is in part a function of the price
19 differential per MWh between western PJM coal and eastern PJM gas fired
20 generation. Coal based generation is much more carbon intensive than that of
21 natural gas, producing approximately 2.0 pounds of carbon dioxide per kilowatt
22 hour. If the objective of future Federal legislation is to significantly reduce
23 greenhouse gas emissions, such legislation may seek to “level the playing field”
24 between the net costs of gas and coal generation. In this scenario the costs of
25 carbon allowances might be set in such a way as to eliminate the coal/gas price
26 differential. For example, the graphic depiction of carbon costs in **EXHIBIT 11**
27 suggests that if carbon allowances exceeded \$10 per metric ton, the coal/gas price
28 differential would disappear if natural gas were priced at \$6 per million Btu.
29 Similarly at \$7/million Btu the price differential would be zero if carbon
30 allowances were priced above \$20 per metric ton.
31

32 The exact consequences of a zero or reduced gas/coal price differential resulting
33 from carbon regulatory costs are uncertain but without doubt represent a
34 significant risk to West Virginia ratepayers supporting the costs of the TrAIL line.
35

36 This issue of carbon regulation has been substantially addressed in a variety of
37 state regulatory venues. In many of these settings state regulators have made
38 resource and investment decisions on the basis of extensive analyses of projected
39 carbon allowance costs⁹. Similarly, TrAILCo should be required to thoroughly
40 assess these risks in order to ensure minimal ratepayer exposure factors that may
41 impact the financial performance of the proposed TrAIL line.
42
43

⁹ There are numerous regulatory proceedings in which carbon allowance cost projections were a significant factor in electric resource decisions which can be identified upon request.

1 Q. IN YOU OPINION, WHAT IS THE LIKELIHOOD OF THE ADOPTION OF A
2 CARBON TAX OR “CAP AND TRADE” REGULATORY REGIME DURING
3 THE EXPECTED LIFETIME OF THE PROPOSED TRAIL LINE?
4

5 A. It is difficult to predict when such a regime might be implemented. However,
6 there appears to be a growing scientific and political consensus that the issue of
7 climate change requires a strong policy initiative in respect to continuously
8 growing US carbon emissions.
9

10 Increasing public and bi-partisan political support for carbon emissions legislation
11 strongly suggests that such legislation will be forthcoming well within the lifetime
12 of the proposed TrAIL line. For example, Senator Warner, the Republican senator
13 from Virginia, formerly an opponent of carbon legislation, is now co-sponsoring
14 “America’s Climate Security Act” (ACSA), a “cap and trade” proposal that sets
15 ambitious targets for reduced carbon emissions¹⁰.
16

17 The inability to exactly predict the likelihood of household fires or floods does
18 not preclude the wisdom of purchasing insurance to protect against those
19 uncertain risks. Similarly, a more thorough assessment of the possible
20 implications of carbon regulation represents a form of “insurance” against the
21 possible negative economic impacts of carbon emissions regulation on West
22 Virginia ratepayers.
23

24 Q. ONE POSSIBLE CONSEQUENCE OF THE INCREASED TRANSFER OF
25 ELECTRICITY FROM WEST VIRGINIA AND WESTERN PJM IS THAT
26 THE OVERALL REGIONAL FUEL MIX WILL BECOME MORE “CARBON
27 INTENSIVE” DUE TO INCREASED TRANSFERS OF COAL GENERATED
28 ELECTRICITY. IN WHAT MANNER DID TRAILCO ASSESS THE
29 IMPLICATIONS OF INCREASED CARBON EMISSIONS RESULTING
30 FROM SUCH A SCENARIO?
31

32 A. TrAILCo conducted no analysis of the implications of increased carbon emissions
33 resulting from changes in the region’s electric fuel mix.
34

35 Q. TRAILCO ATTRIBUTES THE NEED FOR TRANSMISSION
36 ENHANCEMENTS TO THE CONTINUED RAPID GROWTH OF REGIONAL
37 ELECTRICTY DEMAND. ARE THERE SUBSTANTIAL REASONS TO
38 BELIEVE THAT THE RATE OF DEMAND GROWTH WILL BE REDUCED
39 BELOW TRAILCO EXPECTATIONS?
40

41 A. Yes. The wide ranging economic and environmental costs of unrestrained electric
42 demand growth are becoming widely recognized by policy makers at all levels.
43 Rapid demand growth across America has resulted in a number of ambitious new
44 policy initiatives and demand reduction programs with the objective of reducing

¹⁰ For a brief summary of the ACSA legislative proposal and the extent of its legislative support, see the
“Economist,” November 17, 2007, page 35.

1 demand growth and enhancing ratepayer energy efficiency. It is increasingly
2 apparent that this type of demand initiative will be adopted in the PJM area and
3 will have significant impacts on reducing demand in the region to be served by
4 the TrAIL line.

5
6 Increased interest in these initiatives, in all regions, is the consequence of the
7 following factors:

- 8
9 a) Rapid demand growth can imperil the reliability of electric service unless new
10 capacity is constructed to keep pace.
11 b) Obtaining regulatory approvals and public support for new generation and
12 transmission capacity is increasingly problematic and expensive.
13 c) Construction costs for new generation capacity have increased dramatically.
14 In large part this is the result of increased international demand for these
15 facilities and associated components and skilled labor.
16 d) Increased public concern about increasing carbon emissions, climate change
17 and other environmental impacts has galvanized growing public opposition to
18 new facilities.
19 e) Increases in primary fuel price levels and price volatility has made
20 investments in reduced demand and energy consumption more economically
21 attractive in comparison to traditional “supply side” resources.
22 f) Policy makers increasingly recognize that demand reductions can reduce
23 energy costs at both the wholesale and retail levels.
24 g) Successful large scale demand reduction efforts in a number of “early
25 adopter” states have demonstrated that the acquisition of demand side
26 resources is achievable and cost-effective.
27 h) Careful assessments of DSM resource potential in a number of states has
28 demonstrated that these resources are abundant, under-utilized and
29 comparatively inexpensive.

30
31 For these reasons, and others, governments, utilities and RTOs nationwide are
32 showing rapidly increasing interest in implementing ambitious programs and
33 policies with the objective of reducing energy consumption and peak demands. In
34 many areas of the US utility and public spending on demand programs is
35 increasing at a very rapid pace, often driven by public policy mandates to reduce
36 electric load growth, in some cases to zero annual growth rates.

37
38 Reflecting increased activity nation wide, in 2005 US states spent a total of \$1.9
39 billion on demand side programs, a 23% increase over 2004 levels. The number
40 and scope of these state energy demand reduction objectives is growing at a
41 surprising rate. The table below identifies the achievements of a number of state
42 demand side programs in 2005 alone¹¹.

43
44

¹¹ This data reflects data provided by utilities and state regulatory agencies in a 2007 study. See DSM in North America, Summit Blue Consulting, 2007.

Incremental DSM Program Results in 2005				
State	Energy Savings (GWh)	Peak Demand Savings (MW)	Energy Savings as % of Sales	Demand Savings as % of Peak Demand
California	2597	495	1.4%	1.1%
Minnesota	441	160	1.9%	1.2%
New Jersey	378	73	1.0%	0.7%
New York	1369	288	1.1%	0.7%
Texas	509	181	0.3%	1.0%
Vermont	57	9	1.0%	0.5%
Wisconsin	221	38	0.3%	0.2%

1
2 Q. SOME STATES, UTILITIES AND REGULATORY BODIES HAVE
3 CONDUCTED SYSTEMATIC ASSESSMENTS OF THE MAGNITUDE OF
4 AVAILABLE DEMAND SIDE RESOURCES. CAN YOU PROVIDE ANY
5 SUCH ESTIMATES?
6

7 A. In its recently published Virginia Energy Plan¹², the Commonwealth of Virginia
8 summarized a number of such assessments conducted in a number of US states.
9 These assessments of achievable demand side potential are summarized in data
10 extracted from Table 3-2 of that report. Note that “horizon” in the table below
11 indicates the number of years necessary to achieve the stated demand side
12 savings.
13
14

Comparison of Achievable Demand Side Savings Estimates in US States		
State	Horizon (years)	Percent Savings
Conn.	8 years	17%
Georgia	10 years	20%
North Carolina	10 years	20%
New York	9 years	30%
Washington (State)	20 years	12%
Vermont	8 years	19%

15
16
17 Q. ON THE BASIS OF THESE DSM ASSESSMENTS AND ADDITIONAL
18 VIRGINIA-SPECIFIC ANALYSIS, WHAT HAS THE STATE OF VIRGINIA
19 CONCLUDED ABOUT THE AVAILABILITY OF ACHIEVABLE DEMAND
20 SIDE SAVINGS IN THAT STATE?
21

¹² **EXHIBIT 5.** The Virginia Energy Plan, Commonwealth of Virginia, 2007.

1 A. In Table 3-4, the Virginia Energy Plan estimated that over a ten year period
2 electric energy requirements in the state could be reduced, cost effectively, by
3 14%. See the table below for estimates by customer sector.
4

Virginia Savings: 10 Year Achievable and Cost Effective Savings	
Customer Sector	Percent Savings
Residential	15%
Commercial	17%
Industrial	12%
Total – All Sectors	14%

Q. BASED ON THESE ASSESSMENTS, WHAT SPECIFIC REDUCTIONS IN
PEAK DEMAND DOES VIRGINIA ENVISION AS ACHIEVABLE AND
COST EFFECTIVE?

A. In Table 2-4, the Virginia Energy Plan estimates that by 2016 peak reductions of
5,495 MW can be produced by the application of demand side programs.

Q. DOES THE VIRGINIA ENERGY PLAN CONSIDER ANY BENEFITS OF
REDUCING ELECTRICITY IMPORTS INTO THE STATE VIA THE TRAIL
LINE OR OTHER TRANSFER CAPABILITIES?

A. Yes. The document specifically discusses a variety of public interest benefits to
the state of Virginia associated with reducing electricity imports from West
Virginia and other states. Currently, the state imports roughly 30% of its
electricity. In Table 2-8, the Virginia Energy Plan estimates each reduction of 1%
in these imports result in a net in-state benefit of \$20.1 million.

Q. HAS ALLEGHENY POWER ESTIMATED THE AVAILABILITY AND
COSTS OF LARGE SCALE DEMAND SIDE RESOURCE ACQUISITION IN
JURISDICTIONS OUTSIDE WEST VIRGINIA?

A. Yes. On October 26, 2007 Allegheny Power (operating as Potomac Edison) filed
with the Maryland PSC a report entitled “Energy Efficiency, Conservation, and
Demand Reduction Plans”. In that report Allegheny estimated that eight new
demand reduction programs in Maryland “may be able to achieve 269.61 GWh in
cumulative energy savings and 141 MW in cumulative demand savings at a

1 projected cost of \$23.69 million¹³” I recommend that the WVPSC investigate the
2 nature of these programs and consider their adoption in West Virginia as well.
3

4 Q. IN ADDITION TO VIRGINIA, ARE THERE OTHER STATES TO BE
5 SERVED BY THE TRAIL LINE THAT ENVISION SIGNIFICANT
6 REDUCTIONS IN DEMAND AND DEMAND GROWTH?
7

8 A. Yes. For the reasons described above many states in the region are investigating
9 or implementing ambitious demand reduction strategies similar to those defined in
10 Virginia. Specific examples of these initiatives are in evidence in Maryland and
11 Pennsylvania.
12

13 In Maryland both PSC case # 9111 and the “Empower Maryland” initiative
14 announced by the Governor in July 2007 envision ambitious efforts to reduce
15 electric demand growth. In particular, EmPower Maryland is a program
16 announced by Governor Martin O’Malley that envisions a statewide fifteen
17 percent reduction in total electric usage in Maryland on a per capita basis by
18 2015.
19

20 In Pennsylvania, the PUC under Docket No. M-00061984 is evaluating the
21 potential benefits of a significant expansion of demand side efforts in the state. An
22 investigation of these issues was conducted by Commission staff with the
23 assistance of the Demand Side Response Working Group and a report was filed at
24 the PA PUC on June 6, 2007.
25

26 Q. IT IS CLEARLY A CENTRAL OBJECTIVE OF THE TRAILCO PROPOSAL
27 TO PROVIDE ELECTRIC TRANSFER CAPABILITY TO THE ELECTRICITY
28 MARKETS IN VIRGINIA, MARYLAND, PENNSYLVANIA AND OTHER
29 STATES IN THE REGION. DOES THE TRALCO APPLICATION CONTAIN
30 EXPLICIT CONSIDERATION OF THE IMPLICATIONS OF THE SIZABLE
31 DEMAND REDUCTIONS ENVISIONED IN THOSE STATES?
32

33 A. No. In part due to the rapid evolution of energy policy and demand initiatives in
34 the region TRAILCO’s application does not consider the range of possible
35 consequences of regional demand reductions of the scale outlined in Virginia and
36 other states.
37

38
39 Q. TRAILCO'S APPLICATION INDICATES THAT WEST VIRGINIA'S
40 ALLOCATION OF COSTS FOR THE TRAIL LINE MAY CHANGE OVER
41 TIME. IS IT POSSIBLE THAT SUCCESSFUL EFFORTS TO REDUCE
42 ELECTRIC DEMAND IN VIRGINIA AND OTHER STATES COULD
43 AFFECT THE SIZE OF WEST VIRGINIA'S ALLOCATION?
44

¹³ See TrAILCo attachment TO SIERRA-IV-I I-A, page 3. This information is contained in a letter from Allegheny Power to the Maryland PSC dated October 26, 2007.

1 A. I believe that such a change in allocation is possible, particularly if FERC or the
2 Federal government adopt policies to recognize and promote successful state
3 efforts to reduce demand growth and/or greenhouse gas emissions.
4

5

6 Q. BASED ON THE ANALYSIS COMPLETED BY THE COMMONWEALTH OF
7 VIRGINIA, WHAT LEVEL OF DEMAND SIDE SAVINGS COULD BE
8 ACHIEVED OVER A TEN YEAR PERIOD IN WEST VIRGINIA AND THE
9 PJM REGION?
10

10

11 A. Based only on Virginia's analysis, West Virginia and the PJM region could cost
12 effectively achieve, over a ten year period, reductions of approximately 14% of
13 peak demand¹⁴.
14

14

15 Q. CAN YOU CITE ANY ADDITIONAL ESTIMATES OF POTENTIAL
16 DEMAND REDUCTIONS IN THE PJM REGION THAT MIGHT PRODUCE
17 RELIABILITY AND OTHER BENEFITS TO THE REGION?
18

18

19 A. Yes. An analysis conducted in 2007 by the American Council for an Energy
20 Efficient Economy estimated that cumulative cost effective peak reductions
21 approximately 24,068 MW could be achieved in the PJM region. Similar to the
22 Virginia estimate, this would represent roughly 15% of PJM's 2022 forecast
23 summer peak demand¹⁵. This estimate of multi-year cumulative MW savings is
24 also congruent with the annual rate of 0.5% to 1.0% peak MW savings achieved
25 by active demand programs in a variety of US states.
26

26

ACEEE Estimate of Total Demand Side Resource Potential in PJM	
Demand Resource Type	Total Potential (MW)
Energy Efficiency	15,503 MW
Demand Response	8,565 MW
Total Peak MW Savings	24,068 MW

27

28 Q. DID TRAILCO CONDUCT AN ANALYSIS OF THE IMPLICATONS OF
29 DEMAND REDUCTONS OF THIS SCALE ON THE VIABILITY OF THE
30 PROPOSED TRAIL LINE?
31

31

32 A. No such analysis was conducted. TrAILCo did not conduct scenario analyses
33 assessing the impacts of different regional demand levels on the financial
34 performance of the TrAIL line.
35

35

¹⁴ It must be emphasized that an actionable assessment of potential demand savings requires an extensive state-specific analysis well beyond the scope of this testimony.

¹⁵ **EXHIBIT 7** - Comments of the American Council for an Energy Efficient Economy (ACEEE) at the USDOE Draft Electric Transmission Corridor hearings, Docket # 2007-OE-01, page 2.

1 Q. PLEASE IDENTIFY EXAMPLES OF THE TYPES OF ENERGY EFFICIENCY
2 PROGRAMS THAT COULD PRODUCE SUCH A HIGH LEVEL OF PEAK
3 SAVINGS.

4
5 A. An excellent example of an energy efficiency program that could produce high
6 peak MW savings would be a targeted effort to promote the replacement of
7 existing low efficiency residential air conditioners with equipment with higher
8 peak demand performance. Such programs operating in many US states provide
9 ratepayers with financial incentives to purchase air conditioning equipment with
10 higher peak performance (EER) and seasonal energy performance (SEER)
11 ratings¹⁶.

12
13 According to TrAILCo, there are a total of approximately 684,190 residential
14 households with central air conditioning units in the service territories of
15 Allegheny Power alone¹⁷. At two to three kilowatts demand per unit, their
16 operation represent a very sizable fraction of the total Allegheny's 3,714 MW of
17 peak residential demand.

18
19 According to field measured savings used by a major utility DSM program in
20 New England, the replacement and proper installation of a single new three ton
21 12.5 EER air conditioning unit will produce summer peak savings of 0.473 kW¹⁸.
22 Thus, the gradual replacement of approximately 600,000 residential units in the
23 Allegheny service territories over a multi-year period would represent a potential
24 on-peak savings of roughly 283 MW or 7.6% of Allegheny's peak residential load
25 of 3714 MW. Note that these 7.6% savings estimates applies to central air
26 conditioning end-uses only and does not include potential demand savings from
27 other residential appliances operating on-peak.

28
29
30 Q. PLEASE IDENTIFY EXAMPLES OF THE TYPES OF DEMAND RESPONSE
31 PROGRAMS THAT COULD PRODUCE HIGH LEVELS OF PEAK MW
32 SAVINGS.

33
34 A. An example of such a demand response opportunity would be the promotion of
35 the direct load control (DLC) of the peak loads of a substantial proportion of
36 existing residential air conditioners in the Allegheny Power service territories.
37 This strategy would enable the controlled cycling, on peak, of a portion of the

¹⁶ See www.mycoolsmart.com for details.

¹⁷ See TrAILCo response to SIERRA-IV-INT-16.

¹⁸ This estimate was developed under regulatory oversight by National Grid's Massachusetts affiliate. See National Grid Savings Estimates for Residential HVAC, 2007.

1 roughly 1500 MW of peak residential central air conditioning loads likely
2 operating at Allegheny's system peak¹⁹.

3
4 Another example would be the rapid adoption, by PJM, of a capacity auction
5 framework modeled on the Forward Capacity Market (FCM) currently being
6 implemented by ISO New England. The FCM is a wholesale market designed by
7 the six New England states to promote investment in both supply and demand
8 side electric resources. It is the first capacity market in the US that includes a full
9 range of demand side resources as fully qualified capacity resources. In the ISO
10 New England FCM a total of 2400 MW of demand side savings projects will be
11 available for auction in February 2008. This scale of demand reduction, if
12 coincident with peak, would represent approximately 8.5 % of total ISO New
13 England summer peak demands.

14
15
16 **Q. YOU INDICATE THAT DEMAND RESPONSE PROGRAMS ARE GREATLY**
17 **UNDERUTILIZED. CAN YOU PROVIDE A SPECIFIC EXAMPLE OF SUB**
18 **OPTIMAL DEMAND RESPONSE PARTICIPATION AND DEMAND**
19 **SAVINGS ACQUISITION?**

20
21 **A.** Yes. In Allegheny Power's recently filed "Energy Efficiency, Conservation, and
22 Demand Reduction Plans" in Maryland, identifies very limited results from the
23 PJM demand response programs in that state. According to this report "Currently
24 there is only one Allegheny customer registered in the PJM Economic Load
25 Response program. ..There are no usage reductions as a result of customer
26 participation in this program included in Allegheny's current analyses²⁰".

27
28 **Q. 553 US UTILITIES REPORTED THEIR LEVELS OF 2005 DEMAND**
29 **SIDE ACTIVITY TO THE US ENERGY INFORMATION**
30 **ADMINISTRATION. WHAT LEVEL OF DEMAND SIDE ACTIVITY IN**
31 **WEST VIRGINIA AND THE PJM AREA IS IDENTIFIED IN THIS EIA**
32 **INFORMATION?**

33
34 **A.** A number of PJM utilities did not report this data in any form to EIA. This
35 suggests that demand side activity, spending and achievements were insignificant
36 for those utilities. For those PJM utilities that did provide demand side data to
37 EIA Potomac Electric Power Company is typical. Despite 2005 sales of 14.6

¹⁹ The estimate of 1500 peak MW was based on assumed 600,000 three ton air conditioners operating at 1.0 kW/ton and utilizing an assumed peak coincidence factor of 85%. The use of West Virginia coincidence factors and prevailing kW/ton equipment ratings will likely produce an estimate of air conditioning load greater than 1500 MW.

²⁰ See page 42 of the Allegheny filing with the Maryland PSC included in TrAILCo's response to Sierra Club 's Fourth Discovery Request.

1 million MWh Potomac Edison reported zero energy reductions resulting from
 2 demand side programs²¹.
 3
 4

5 **Q. WHAT ARE THE CUSTOMER SIZE REQUIREMENTS FOR**
 6 **PARTICIPATION IN THE PJM DEMAND RESPONSE PROGRAMS**
 7 **AVAILABLE TO ALLEGHENY CUSTOMERS?**
 8

9 **A.** The minimum kW requirement to participate in the Generation Buy Back
 10 program is 300 kW. The minimum kW requirement to participate in the PJM
 11 Load Response program is Back 100 kW. Participation in the PJM ILR program
 12 requires that the customer have the ability to drop load upon request from PJM.
 13

14 **Q. WHAT IS THE TOTAL PEAK LOAD OF ALLEGHENY CUSTOMERS THAT**
 15 **EXCEED 100 KW AND ARE THUS ELIGIBLE FOR PARTICIPATION IN**
 16 **THE GENERATION BUY BACK AND LOAD RESPONSE PROGRAMS?**
 17 **WHAT WERE THE ACHIEVEMENTS OF THESE PROGRAMS IN 2006?**
 18

19 **A.** The total peak load of Allegheny customers with peak loads greater than 100 kW
 20 was 3,409 in 2006. According to TrAILCo's response to SIERRA-V-INT-16 there
 21 was no MW reductions from the Generation Buyback program in 2006. A total of
 22 14 large Allegheny customers participated in the PJM Load Response Program,
 23 producing a total peak load reduction of 399.4 MW. Thus, savings in this sector
 24 represents 11.7% of total large customer load.
 25

26 **Q. PLEASE DESCRIBE THE DEMAND PROGRAMS AVAILABLE TO**
 27 **ALLEGHENY CUSTOMERS WITH LESS THAN 100 MW IN PEAK LOAD.**
 28 **PLEASE DESCRIBE THE PARTICIPATION AND DEMAND SAVINGS**
 29 **ACHIEVED IN THESE CUSTOMER SECTORS.**
 30

31 **A.** Residential and business customers with less than 100 MW of peak load
 32 represented approximately 61% of total Allegheny Power 2006 peak load.
 33 However, despite the size of this sector TrAILCo's response to SIERRA-V-INT-
 34 20 confirms that no programs are currently producing peak load reductions for
 35 this class of customer. As discussed below this reflects the absence of DLC or
 36 equipment upgrade programs for end-uses that have high coincidence factors with
 37 system peak (eg air conditioning).
 38

Allegheny Power – 2006 Peak Loads and Load Reductions		
Customer Sector	Peak Load (MW)	Demand Reduction
>100 MW	3409 MW	399 MW (11.7%)
<100 MW	5324 MW	0 MW (0%)
All Loads	8733 MW	399 MW (4.5%)

39

Q. PLEASE DESCRIBE CURRENT DIRECT LOAD CONTROL EFFORTS WHICH ATTEMPT TO OBTAIN PEAK DEMAND REDUCTIONS FROM ALLEGHENY POWER'S APPROXIMATELY 684,000 RESIDENTIAL AIR CONDITONING UNITS.

A. According to TrAILCo's response to SIERRA-V-INT-26, Allegheny Power conducted, in Pennsylvania, a DLC "Electricity Price Response Pilot Program" during the period 2001 to 2006. The maximum participation in the program during the period was 158 customers. Neither this program nor any other DLC program of its type appears to be available in to Allegheny Power residential customers in 2007.

Q. AS AN INDICATION OF REGIONAL DEMAND SIDE ACTIVITY LEVELS PLEASE IDENTIFY THE LEVEL OF DEMAND SIDE SPENDING FOR UTILITY OPERATED PROGRAMS AS REPORTED BY ALLEGHENY POWER IN 2006 IN ALL ITS RETAIL SERVICE TERRITORIES.

A. According to TrAILCo's response to SIERRA-V-INT-20 its total spending for both demand response and DSM programs in all service territories in 2006 was \$4.04 million. This spending was roughly divided equally into contributions toward low income usage reduction (LIURP) and a Pennsylvania sustainable energy fund (WPPSEF). No MW or MWh savings appear to have been reported associated with these expenditures so they appear to have been primarily "educational" in nature.

Q. HOW DOES THIS LEVEL OF DEMAND SIDE SPENDING COMPARE WITH SPENDING LEVELS FOR UTILITIES WITH ACTIVE DEMAND REDUCTION AND DSM PROGRAMS?

A. Allegheny Power demand side spending is extremely limited in comparison with efforts of many other utilities. In many states demand side expenditures exceed 0.5% or 1.0% of total retail revenues. As cited in the earlier example of Massachusetts Electric, these programs also produce reportable and verified demand and energy savings.

Q. DID TRAILCO'S APPLICATION ADDRESS THE IMPLICATIONS OF DEMAND REDUCTIONS RESULTING FROM IMPROVEMENTS IN AIR CONDITIONING DEMAND PERFORMANCE OR DIRECT LOAD CONTROL OF THIS EQUIPMENT? DID THE APPLICATION CONSIDER THE IMPLICATIONS ON THE NEED FOR THE TRAIL LINE RESULTING FROM ADOPTION OF A PJM FORWARD CAPACITY MARKET THAT INCLUDES SUBSTANTIAL DEMAND REDUCTIONS AS QUALTIFIED CAPACITY RESOURCES?

1 A. No. TrAILCo did not complete such an analysis of potential peak savings from air
2 conditioning DLC or equipment efficiency upgrades. Nor did it complete an
3 assessment of demand savings associated with improvements to any other end-use
4 technologies.

5
6 Q. THE STATE OF VIRGINIA, AN AREA TO BE SERVED BY PROPOSED
7 LINE, HAS RECENTLY ADOPTED A STATE ENERGY POLICY WITH
8 AGGRESSIVE GOALS IN RESPECT TO REDUCING DEMAND GROWTH
9 AND STATE ENERGY CONSUMPTION. MARYLAND AND
10 PENNSYLVANIA ARE ALSO ADOPTING OR CONSIDERING ADOPTING
11 SIMILAR DEMAND REDUCTION GOALS. CAN YOU DESCRIBE THE
12 POSSIBLE IMPLICATIONS OF NEW STATE ENERGY POLICIES SUCH AS
13 THESE FOR THE PROPOSED TRAIL PROJECT?
14

15 A. A precise estimate of the financial impact of reduced energy transfers to those
16 states is well beyond the scope of this testimony. However, reduced demand for
17 any “product” is normally associated with reduced revenue flows and weakened
18 financial viability.
19

20 Q. AS YOU INDICATE, AGGRESSIVE DEMAND SIDE PROGRAMS IN SOME
21 US STATES HAVE PRODUCED ANNUAL INCREMENTAL PEAK MW
22 SAVINGS OF 1%. HAS TRAILCO ANALYZED THE IMPACT THAT THE
23 IMPLEMENTATION OF THIS TYPE OF PROGRAM WOULD HAVE ON
24 SYSTEM RELIABILITY OR THE ECONOMIC VIABILITY OF THE TRAIL
25 LINE?
26

27 A. Despite that possibility that the widespread adoption of such demand reduction
28 programs could reduce the demand for electricity transfers through the TrAIL line
29 TrAILCo’s response to SIERRA-IV-INT-9 was that “there have been no such
30 studies performed by TrAILCo”.
31

32
33 Q. CURRENTLY DEMAND GROWTH IN PJM IS PROJECTED TO BE
34 APPROXIMATELY 1.5% PER YEAR. HAS TRAILCO ANALYZED THE
35 POSSIBLE IMPACT ON THE NEED FOR RELIABILITY IMPROVEMENTS
36 OR THE ECONOMIC VIABILITY OF THE TRAIL LINE IF PJM DEMAND
37 GROWTH IS REDUCED BY DEMAND PROGRAMS TO BELOW THAT
38 1.5% LEVEL?
39

40 A. According to TrAILCo’s response to Sierra-IV-INT-9, TrAILCo has not
41 conducted such a scenario analysis of varying demand growth levels.
42

43 Q. HAS ALLEGHENY POWER OR ANY OF ITS AFFILIATES CONDUCTED
44 ASSESSMENTS OF THE COSTS OR AVAILABILITY OF COST EFFECTIVE
45 DEMAND SIDE RESOURCE POTENTIALS IN THE AREAS TO BE SERVED
46 BY THE TRAILCO LINE?

1
2 A. According to TrAILCo’s response to Sierra-IV-INT-9, Allegheny Power has not
3 conducted formal assessments of total cost-effective Demand Side resource
4 potentials (in MW & MWh)..
5

6
7 Q. IN YOUR OPINION, WHY ARE DEMAND REDUCTION STRATEGIES
8 UNDER-UTILIZED IN WEST VIRGINIA AND THE PJM REGION?
9

10 There are a variety of reasons that demand response and demand side
11 management programs are under-utilized in the region. Ultimately, I believe these
12 “barriers” must be eliminated by regulators and other policy makers if electric
13 reliability and reasonable electric costs are to be sustained.
14

- 15 1- The regional organization (PJM) responsible for system reliability has
16 limited tools to stimulate reduced demand even in areas of transmission
17 congestion.
- 18 2- Funding and/or cost recovery for demand reduction programs is often
19 uncertain, absent or inadequate.
- 20 3- Regulators have not removed regulatory disincentives for utility programs
21 that improve ratepayer energy efficiency.
- 22 4- Regulators have not established financial incentives for utility success in
23 reducing demand and energy consumption.
- 24 5- Difficulties in establishing appropriate price signals to motivate changes
25 in energy use for all customer sectors.
- 26 6- Demand program “cost effectiveness” is defined in such a way that many
27 of these programs are discouraged.
- 28 7- Utilities and regulators are unaware of effective program and regulatory
29 approaches applied in other regions.
30

31 Q. BEYOND THE PEAK DEMAND AND RELIABILITY BENEFITS
32 DISCUSSED EARLIER, CAN YOU SUMMARIZE THE MAJOR REASONS
33 WHEN EXPANDED DEMAND SIDE PROGRAMS WOULD SERVE THE
34 PUBLIC INTEREST IN WEST VIRGINIA AND THE PJM REGION?
35

36 A. The following public interest objectives that will be served by
37 accelerating the scale of demand side programs. Note that many of these specific
38 benefits are substantiated by a number of recently released reports produced with
39 extensive support of state regulators, federal agencies and a variety of electric
40 utilities. Notable among these is **EXHIBIT 9**, the National Action Plan for
41 Energy Efficiency, co-chaired by the President of the National Association of
42 Regulatory Commissioners and the Chief Executive of Duke Power.
43

44 *(a) DSM and DR promote the public interest by minimizing long*
45 *term electric resource costs.*
46

1 As is demonstrated in **EXHIBIT 5, The Virginia Energy Plan**, national utility
2 experience with DSM programs establishes that aggressive programs are cost
3 effective relative to most supply side resources. Nationwide, average levelized
4 costs of utility DSM programs are approximately \$0.03 to \$0.04 per saved kWh,
5 less than the levelized cost per kWh of recently proposed new coal generation²².
6

7 *(b) Demand Side Resources provide additional diversity*
8 *benefits in a volatile energy environment*
9

10 TrAILCo's proposal arrives at a time of highly volatile and uncertain fuel,
11 environmental, and construction costs. Failure to anticipate these uncertainties by
12 means of diversification and other strategies will likely shift a substantial portion
13 of those risks to West Virginia ratepayers.
14

15 Currently, West Virginia's electricity portfolio is extraordinarily dependent on coal
16 fired generation. According to the US Department of Energy in 2006 97.5% of
17 the 93.8 million megawatt hours generated in the state were produced using coal
18 as the primary fuel. This dependence on a single fuel asset has remained largely
19 unchanged since 1990 when 97.6% of MWh were produced from coal. West
20 Virginia currently has the sixth most carbon-intensive electric system in the US.²³
21

22 On an individual level, a financial portfolio so heavily dependent on a single asset
23 would clearly represent a high risk of exposure to a variety of risks. In the case of
24 personal financial planning, the systematic mitigation of these risks would be
25 largely achieved by means of portfolio diversification and other risk management
26 strategies. West Virginia's high degree of dependence on coal presents a similar
27 concentrated exposure to risks and requires a similar diversification. The
28 development of significant DSM and DR resources in West Virginia is an
29 essential step toward crucial energy diversification in the state.
30

31 **In West Virginia, specific diversity benefits from DSR would include the**
32 **following:**

33 a) *DSR will reduce West Virginia's exposure to CO₂ regulatory risk.*
34 Since DSM is an electric resource that reduces carbon emissions, an electric
35 portfolio with sizable demand side resources will provide West Virginia with a
36 hedge against future costs associated with power plant carbon emissions.
37 Reducing the state's current high level of carbon intensity will also reduce

²² This estimate is based on 2007 cost estimates for new coal generation presented to state regulators in Louisiana, Oklahoma, Florida and other venues. DSM costs per kWh are from the Virginia Energy Plan and a variety of other sources.

²³ See **EXHIBIT 10, EERE**, Table 5. Electric Power Industry Generation by Primary Energy Source, 1990 Through 2006 (Megawatthours)

1 ratepayer exposure to compliance costs associated with future greenhouse gas
2 regulation.
3

4 ***b)) DSR can defer the need for costly new generation.***

5 Although West Virginia currently has excess electric capacity available for
6 export, increased exports via TrAIL and other new transmission capabilities will
7 accelerate the need for the development of new in-state generation. Allegheny
8 Power indicated in recent WVPSC "Smart Metering" hearings that appropriate
9 demand reduction programs need to be developed with the objective of
10 lowering peak demand, thereby "lowering the need for future capacity
11 additions"²⁴.
12

13 Before implicitly agreeing to increased electricity exports West Virginia policy
14 makers should be fully cognizant of the likely future costs of developing new in-
15 state capacity. Unfortunately, construction costs associated with the development
16 of such new generation capabilities are inflating at a rapid rate. Dramatic
17 increases in international demand for electric capacity, associated engineered
18 materials and other factors are continuing to drive capacity construction costs
19 upward \$3000 or more per kW.
20
21

22 A final issue here is the question of the degree to which electricity exports via the
23 TrAIL project will result in increased utilization rate of existing West Virginia
24 generation facilities. Is it possible that increased "wear and tear" on these facilities
25 resulting from higher utilization rates will produce increased rates of component
26 failure and/or higher operation and maintenance costs? Is it possible that
27 increased capacity factors resulting from electricity exports will diminish the
28 expected remaining lifetime of these plants and accelerate the need for their
29 replacement by West Virginia ratepayers?
30

31 Although these are clearly important issues for West Virginia ratepayers,
32 TrAILCo has been unresponsive to specific questions in respect to changes in
33 capacity factor and utilization rates of West Virginia generation resulting from the
34 proposed transmission project. As a result, no informed assessment of these issues
35 can be made. We encourage the WVPSC to make a full investigation of these
36 scenarios.
37
38

39 ***c) DSR will reduce wholesale electric costs, consumers' electric***
40 ***bills and reduce the cost of operation of West Virginia***
41 ***businesses***
42

²⁴ Smart Metering Hearings WV. Case No. 06-0708-E-GI, Initial Information Requests to Electric Utilities, Allegheny Power response to question #6.

1
2 As discussed elsewhere, The Brattle Group's report for the PJM MADRI states
3 estimated reductions in whole costs of 5% to 8% resulting from a 3% curtailment.
4

5 Additional benefits for state ratepayers would be produced by DSM programs that
6 promote ratepayer investments in high efficiency air conditioners, lighting,
7 industrial process equipment and other end-use equipment. By permanently
8 improving the energy efficiency of ratepayer homes and businesses, DSM of this
9 type programs will reduce the energy bills and the costs of operation for West
10 Virginians. As an example of what might be applied in the State, the 1,363
11 commercial and industrial customers who participated in National Grid's
12 Massachusetts Electric DSM programs in 2005 saved a total of 76.7 million kWh.
13 Over the lifetime of the DSM equipment installed in 2005 alone, these programs
14 produced net benefits of approximately \$57 million. 2005 residential net benefits
15 were approximately \$56 million²⁵. See Exhibits.
16

17 *d) DSR Investments Have Reduced Risks of Asset Stranding.*
18

19 Unlike a power plant or transmission facility, if only 50% of a planned DSM
20 program is completed, the MW and MWh resources from the measures installed
21 will produce long term electric resources in rough proportion to ratepayer
22 expenditures. On the other hand, if a new power plant or transmission project
23 proves to be economically unviable it becomes virtually useless, resulting in a
24 "stranded" liability for utility ratepayers or shareholders. Given the broad
25 uncertainties in future electric demand and regulatory costs that may impact the
26 economic viability of the TrAIL project, this issue should be thoroughly
27 scrutinized by the WVPSC.
28
29

30 *e) Reduced In-State Peak Demand Reductions due to DSM may*
31 *have economic value in the PJM Region or within proposed*
32 *carbon regulatory systems.*
33

34 Elsewhere in this testimony I have estimated that a ten year commitment to
35 demand reduction objectives would reduce peak demands by up to 14%. In
36 addition to the reliability benefits associated with this level of peak demand
37 reduction this scale of incremental capacity would become available for transfer
38 and sale to out of state high demand growth areas such Northern Virginia and
39 other PJM sectors. In fact, it is possible that the costs per kW of demand reduction
40 may be less than the value of the resulting capacity on the wholesale market.
41
42

²⁵ See **EXHIBIT 1**, the 2005 Massachusetts Electric Annual Efficiency Report filed with state regulators in that state.

1 Q. YOU ARGUE THAT THE INCREASED UTILIZATION OF DEMAND SIDE
2 RESOURCES MAY BE A PREFERRED ALTERNATIVE TO THE
3 DEVELOPMENT OF THE TRAIL LINE. WHAT SPECIFIC NEXT STEPS
4 ARE NECESSARY IN ORDER TO FULLY ASSESS THE COMPARATIVE
5 COSTS OF THIS ALTERNATIVE?
6

7 A. I believe that a request for additional information relating to this issue is a prudent
8 and reasonable step for the Commission.
9

10 In particular, an accurate estimate of the costs and availability of demand side
11 resources is essential in order to make an informed decision in respect to the need
12 for the proposed TrAIL transmission line. Such an assessment is also a necessary
13 first step toward the development of an informed and comprehensive state
14 resource policy. I recommend that the Commission direct TrAILCo and its parent
15 company Allegheny Power to promptly complete a thorough study of the
16 economically achievable potential for demand and energy efficiency investments
17 in the Allegheny Power service territory as well on a localized basis in capacity
18 constrained areas of its system. This "DSM resource assessment" should be based
19 on best practices in demand side program design, implementation and
20 performance measurement as approved by state regulators in states with active
21 and sizable DSM programs. As a further guide for the completion of this research
22 I suggest the use of the objectives and methodologies as outlined in the recently
23 published Guide for Conducting Energy Efficiency Potential Studies, produced
24 with the support of the US Departments of Energy and the US Department of
25 Environmental Protection. This publication, supported by the USEPA, USDOE
26 and a number of US utilities, outlines a reasonable and achievable process by
27 which TrAILCo could systematically estimate the availability of demand side
28 resources in West Virginia.
29

30 It is essential that his assessment include a quantification of potential peak
31 demand response resources including reasonable achievable participation levels in
32 all PJM demand response programs as well as aggressive utility operated "load
33 management" programs such as direct load control of air conditioners and other
34 electric end-uses typically operating at system peak.
35

36 Q. YOU ALSO ARGUE THAT PENDING AND RECENTLY ENACTED STATE
37 ENERGY POLICIES IN VIRGINIA AND ADJOINING OTHER STATES MAY
38 IMPACT THE VIABILTY OF THE TRAIL LINE AND HAVE POTENTIAL
39 IMPACTS ON WEST VIRGINIA RATEPAYERS. HOW CAN THE
40 COMMISSION ADDRESS THIS UNCERTAINTY AND PROTECT THE
41 INTERESTS OF RATEPAYERS IN THIS RESPECT?
42

43 A. I recommend that the Commission direct TrAILCo and its parent company
44 Allegheny Power to complete an assessment of possible implications of likely
45 demand reductions resulting from newly enacted energy policies promulgated in
46 PJM states like Virginia and Pennsylvania. In particular, this assessment should a

1 scenario analysis of the possible impacts of varying state and regional electric
2 demand growth rates on the financial viability of the TRAIL line. The assessment
3 should also identify how these diverse growth rates might affect TrAIL associated
4 costs that would be the responsibility of West Virginia ratepayers.

5
6 **Q.** HOW WILL THE RESULTS OF DEMAND SIDE ASSESSMENTS AFFECT
7 THE DEVELOPMENT OF THE TRAIL TRANSMISSION LINE?
8

9 **A.** The assessments outlined will enable the Commission to make a fully informed
10 decision in respect to the appropriate least cost approach to providing low cost
11 and reliable electric service in West Virginia. The assessments will clarify the
12 elements crucial to a decision in respect to the TrAIL line: 1) the sufficiency of
13 achievable demand reductions to produce needed reliability transmission
14 improvements and 2) the relative cost of achieving these demand reductions in
15 comparison to the costs of constructing and operating the TrAIL line.
16 If achievable demand reductions are inadequate and the comparative costs are
17 high construction of the TrAIL line will be conclusively the appropriate choice for
18 West Virginia. On the other hand, if the assessment demonstrates that potential
19 demand savings are abundant and comparatively inexpensive the Commission
20 may decide to further defer approval of the TrAILCo proposal
21

22
23 **Q.** FOLLOWING THE COMPLETION OF AN ASSESSMENT OF AVAILABLE
24 DEMAND SIDE RESOURCES WHAT ARE THE NEXT STEPS TO
25 DEVELOPING THESE RESOURCES IN THE STATE OF WEST VIRGINIA?
26

27 **A.** If the aggressive pursuit of demand side resources is determined to be in the best
28 interests of West Virginia a variety of regulatory rules and mechanisms will
29 require modification to ensure that demand side resources are effectively
30 promoted, funded and incentivized. In the 2006 PSC hearing on Smart Metering
31 Allegheny Power made the following recommendations in this respect:
32

33 *"To devote greater attention to peak-load management, Allegheny Power*
34 *recommends that the Commission adopt the following policies:*

- 35
- 36 *1. Allow the use of a public benefits charge for peak-load management as*
37 *well as for energy efficiency programs;*
- 38 *2. Allow use of consumer education funds to pay for programs to educate*
39 *consumers on the electricity market and fund peak-load management*
40 *programs;*
- 41 *3. Allow the use of a public benefit charge funds to install equipment to*
42 *facilitate real-time pricing and load control;*
- 43 *4. Provide distribution companies the flexibility to create price signals*
44 *through the use of innovative rate designs;*
- 45 *5. Encourage and permit distribution companies the flexibility to establish*
46 *pilot programs offering company-specific tariff services for special*

1 *metering devices and load-control equipment to enable customers to react*
2 *to price signals; and,*
3 *6. Encourage the allocation of more low-income funds to peak-load*
4 *management programs to enable low-income residential customers to pay*
5 *for specialized equipment required to participate in peak-load”*
6

7 While I don't necessarily agree with all of Allegheny's recommendations, they do
8 underline the need for clear regulatory support and adequate funding for increased
9 demand reduction programs. Without such support the availability of DSR
10 resources will be limited In West Virginia.

11
12 As an important supplement to the above Allegheny Power recommendations I
13 would suggest that, in addition, the WVPSC consider the establishment of
14 financial incentives for utility demand and energy reduction improvements and
15 the removal of financial disincentives that deter utility investments in the
16 improved energy efficiency of their ratepayers. I am currently involved in a rule-
17 making docket in the State of Oklahoma to develop demand side regulatory rules
18 with these objectives in mind²⁶. See exhibits for specific rule recommendations I
19 have developed in that venue.
20

21 **Q.** DOES THE US DEPARTMENT OF ENERGY HAVE ANY SPECIFIC
22 RECOMMENDATIONS FOR INCREASING THE SCALE OF DEMAND
23 RESOURCES?
24

25 **A.** Yes. Pursuant to the requirements of the Energy Policy Act of 2005 the
26 (**EXHIBIT 3**) produced a report entitled "Benefits of Demand Response in
27 Electricity Markets and Recommendations for Achieving Them". In this
28 document is a comprehensive list of recommendations for action by regulators,
29 utilities and transmission organizations. Specific recommendations include some
30 of the above suggestions as well additional ideas for large, medium and small
31 electric customers. Included in the many recommendations are the following:
32

33 *a) Traditional load management programs such as direct load control of*
34 *residential and small commercial equipment and appliances (e.g., air*
35 *conditioners, water heaters and pool pumps) with an established record of*
36 *providing cost-effective demand response should be maintained or expanded.*
37

38 *b) State regulatory agencies and electric utilities should consider offering*
39 *participants in load management programs "pay-for-performance" incentive*
40 *designs, similar to those implemented by ISOs/RTOs and some utilities which*
41 *include a certain level of payment to customer who successfully reduce demand*
42 *when called upon to do so.*
43

²⁶ Cause No. RM 200700007, Oklahoma Corporation Commission. "Initial Policy Assessment of Proposed Rules Governing Demand Programs in Oklahoma," pp. 10 – 30, Hale Powell

1 *c)State regulatory authorities should provide cost recovery for demand response*
2 *investments undertaken by distribution utilities.*

3

4

5 **Q. ARE THERE SPECIFIC DEMAND PROGRAM APPROACHES THAT**
6 **SHOULD BE INVESTIGATED IN WEST VIRGINIA IN THE NEAR TERM?**

7

8 **A. As was discussed earlier in this testimony, air conditioning and space cooling**
9 **represents a major element of peak electric load during system peak days. As a**
10 **result, improvements in equipment efficiency, installation practices and**
11 **equipment control will produce sizable peak MW savings benefits. Utilities**
12 **around the US have adopted a variety of demand program models that attempt to**
13 **capture these savings²⁷. West Virginia utilities and regulators may want to**
14 **commence consideration of the following approaches:**

15

16 1) Financial incentive programs that encourage the purchase of high EER (peak
17 demand rating) HVAC equipment for the residential and small commercial
18 market.

19

20 2) Training programs that improve installation practices of HVAC equipment,
21 yielding both demand and energy savings.

22

23 3) "Market transformation" programs jointly operated by utilities and air
24 conditioning manufacturers to increase the "market share" of high efficiency
25 cooling equipment.

26

27 4) Direct load control (DLC) of cooling equipment during periods of transmission
28 congestion or high demand conditions.

29

30 5) Utility assistance with improved state building code requirements and
31 enforcement with the objective of reducing equipment over-sizing and
32 encouraging appropriate equipment installation practices.

33

34 In addition, I recommend that the Commission closely review the costs and
35 benefits of the eight demand programs submitted to the Maryland PSC by
36 Allegheny Power in October 2007. As indicated earlier in this testimony,
37 Allegheny has estimated that these programs could produce high levels of peak
38 savings at a reasonable cost. The joint consideration and adoption of these
39 programs by Maryland and West Virginia might both reduce costs and increase
40 the probability of successful implementation.

41

42 **Q. DOES THIS CONCLUDE YOUR TESTIMONY?**

43

44 **A. Yes.**

²⁷ See www.mycoolmart.com for an example of a multi-utility cooling program that pays incentives for high EER equipment as well as improved contractor installation practices.
